/George Eng/ Supervisory Patent Examiner, Art Unit 2617			

Continuation of 11. does NOT place the application in condition for allowance because: Applicant submits that Kingdon does not teach or suggest the limitiation recited in claims 1 and 26-29 recited "determining a virtual base station estimate...and...providing a second location estimate using one of said different location methods based on the first location estimate and the virtual base station estimate, said second location estimate being a location of a mobile device". The Examiner respectfully disagrees and asserts that these limitations are taught by Kingdon in column 6 and figure 1.

The invention of Kingdon is intended to locate a mobile station using two base stations alternatively from conventional triangulation techniques that require measurements from three base stations (column 3, lines 27-44). Figure 1 illustrates a system comprising two base stations (items 110, 120) including sectors (items 130, 125...). The two base stations attempt to locate the mobile station by making timing advance (TA) measurements. This aspect of Kingdon renders a first location estimate because the base stations estimate the position of the mobile station and the TA measurements render the collected information because they are measured or collected in order to make the location estimate.

Because a third base station is not available to take measurements, Kingdon teaches that it is uncertain whether the mobile station is located at point A or at point B. In order to cure this deficiency, Kingdon teaches that a call setup is performed with the mobile station in order to extract sector information. This information is regarded by the Examiner as the "virtual base station estimate" because of the broad scope of the claim language. The term "virtual base station" is interpreted by the Examiner to mean a base station that is simulated or does not exist. Therefore based on the fact that a sector is not a base station and that the sector information replaces or simulates a third base station that does not exist, this information can be reasonably interpreted as a "virtual base station estimate".

Kingdon further teaches that the mobile positioning center uses the TA measurements taken by the two base stations and the cell sector information to determine whether the mobile station is located at point A or at point B. This determination of the actual position of the mobile device using the TA measurements and the cell sector information renders the "second location estimate" because this estimate is the actual position of the mobile device and is made using a "first location estimate" (TA measurements) and a "virtual base station estimate (cell sector information). Therefore for at least the reasons stated above, the rejection applied to claims 1 and 26-29 have been maintained.
